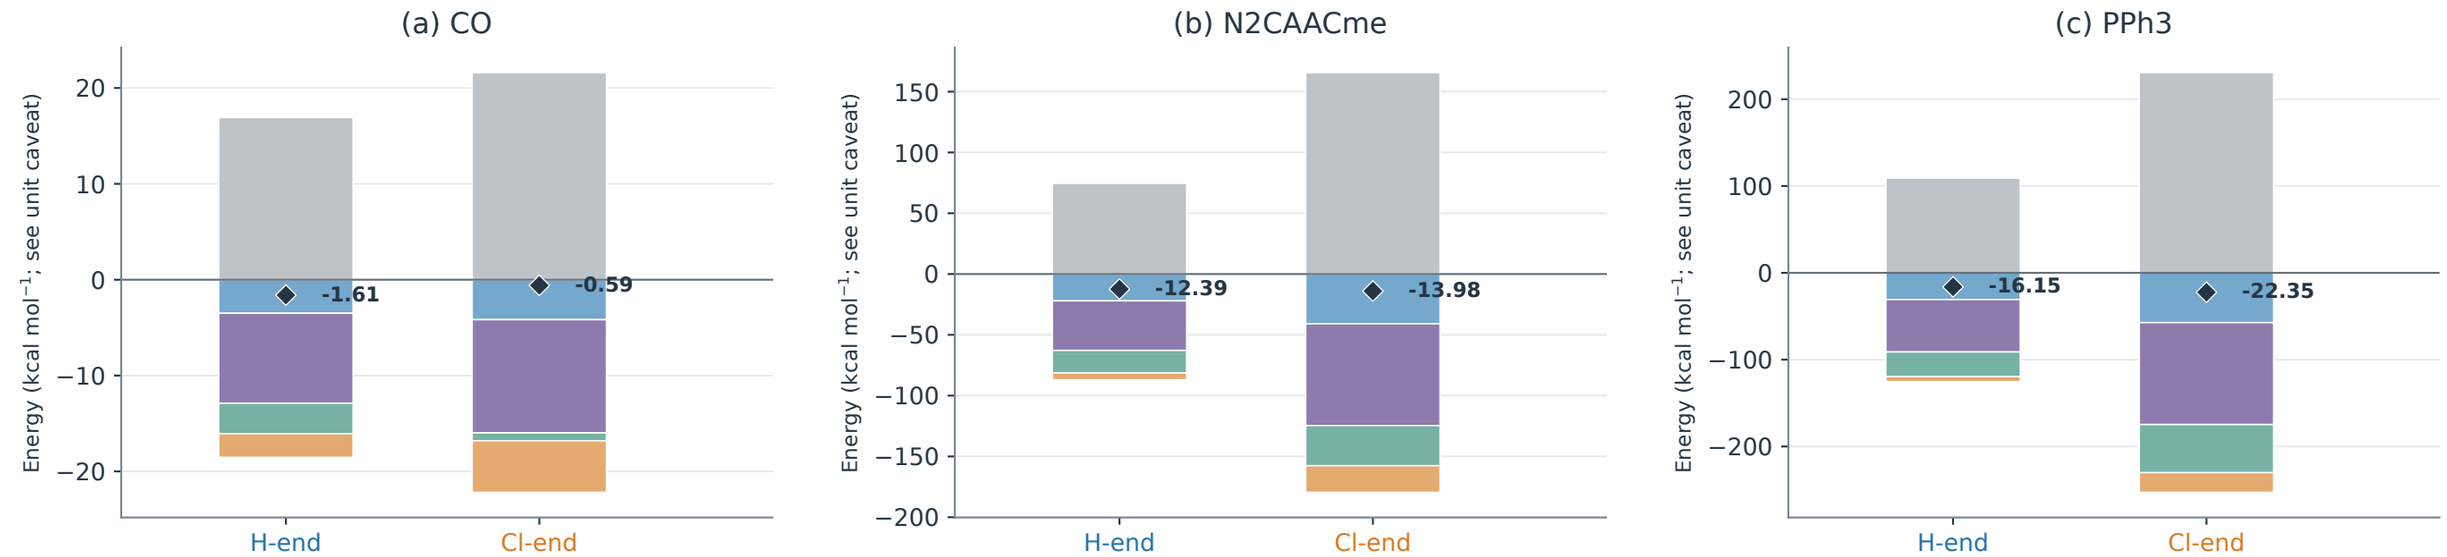
Fig. 3 Five-component EDA: stabilization and cancellation

Provisional data audit | five reported terms retained | each panel has its own y-scale



ES / EX / REP / POL / ECORR are source labels.
No item is omitted or renamed as pure dispersion.
Positive ECORR values are retained.
Compare magnitudes within each labeled scale.

Source: HOClxlsx.xlsx, EDA, columns B–G. Only the ES header explicitly states kcal/mol; a shared component unit is assumed here.
EDA method, fragment definitions, and the physical meaning of individual terms require original-output verification.
These stacks visualize the reported cancellation; they are not percentages and do not uniquely establish the mechanism.
